

ABSTRACT OF THE DISCLOSURE

A data processing system is programmed so that a user may select whether control graphical user interface objects are to be displayed along with the content created with an application running on the data processing system. If the user elects not to display such control objects, then the display screen will only display content objects. A user input into a hardware button, or another type of input such as a stylus stroke can result in the return of the display of the control objects to the user.
